Initial Startup Process

1. Check the Fuel Tank and Switch

Ensure the fuel tank has sufficient fuel and the fuel switch is in the open position.

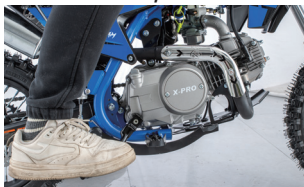

2. Shift to Neutral and Prepare

Shift the transmission into neutral (N), keeping both feet firmly on the ground for stability.

3. Start the Engine

For a cold start, it is recommended to open the choke first. Firmly press down on the kick-start lever with full force until the engine ignites, starts, and runs. Let the engine warm up for about 30–60 seconds, then close the choke.

4. Begin Riding

For manual clutch engines: Squeeze the clutch lever, shift into first gear, gradually release the clutch lever while slowly applying throttle to start moving smoothly.

Frequently Asked Questions

1. Difficulty Starting the Engine

After starting, let the engine warm up in place for 1–2 minutes before riding. Avoid driving immediately or applying sudden throttle when the engine is cold. If idle instability or stalling persists, slightly adjust the idle screw to increase the engine's idle speed.

2. Engine Stalling

If the engine stalls during riding, first check the fuel supply to ensure the tank is not empty. Then inspect the spark plug for cleanliness, cleaning or replacing it if necessary. Ensure the air filter is clean to prevent clogging.

3. Difficulty Shifting Gears

If shifting gears is difficult or feels jerky, confirm that the gear lever is in the neutral position. Ensure the clutch is fully engaged and avoid shifting under heavy engine load. Check the clutch adjustment and, if necessary, adjust the clutch cable.

Initial Startup Process

1. Engine Oil Maintenance

Engine oil plays a crucial role in lubrication and heat dissipation. It is recommended to perform the first oil change after the break-in period, and subsequently every 20–30 hours or at the end of each riding season (whichever comes first). If frequently riding in high-temperature, muddy, or high-load conditions, shorten the oil change intervals accordingly. Typically, 10W40 synthetic oil is recommended. For summer use, 15W40 may be suitable, while 10W30 is preferable for winter. When changing the oil, use the dipstick to check the oil level, ensuring it is within the specified range. Add oil according to the recommended quantity to the designated level, avoiding overfilling or underfilling.

2. Spark Plug and Fuel System Inspection

Inspect the spark plug every 500 km to ensure it remains clean and maintains good ignition performance. Replace it promptly if carbon buildup or damage is detected. Check the fuel system to ensure the fuel filter is not clogged, maintaining smooth fuel supply and preventing engine issues caused by fuel-related problems.

Recommendations	Not Recommended
Check and clean the air filter every 200 to 300 kilometers, replacing it when necessary.	Neglecting to check the battery and electrical system, especially during cold weather.
Inspect and lubricate the chain every 1,000 kilometers to maintain proper tension.	Failing to check or ignoring tire wear and pressure, leading to potential safety hazards.
Check the brake system monthly to ensure the brake pads and brake fluid are in normal condition.	Using a dirty or damaged air filter will affect engine performance.

Note: For more detailed maintenance instructions, please refer to the user manual.

Product Registration and Usage Feedback

Register Your X-PRO Vehicle

Please register your X-PRO vehicle to enable us to provide faster and more accurate service support. Registration allows us to:

- More precisely identify your vehicle and component compatibility
- Offer more efficient assistance when needed
- Archive your ownership information
