Initial Startup Process

1. Check the Fuel Tank and Switch

Ensure the fuel tank has sufficient fuel and the fuel switch is in the open position.

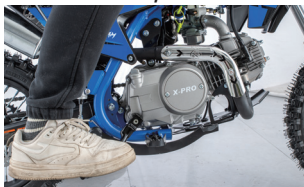

2. Shift to Neutral and Prepare

Shift the transmission into neutral (N), keeping both feet firmly on the ground for stability.

3. Start the Engine

For a cold start, it is recommended to open the choke first. Firmly press down on the kick-start lever with full force until the engine ignites, starts, and runs. Let the engine warm up for about 30–60 seconds, then close the choke.

4. Begin Riding

For manual clutch engines: Squeeze the clutch lever, shift into first gear, gradually release the clutch lever while slowly applying throttle to start moving smoothly.

Frequently Asked Questions

1. Starting/Idling Issues

If the engine is difficult to start, runs unevenly, or does not maintain idle when stopped: Check and replace dirty or damaged spark plugs; clean or replace the air filter; clean the carburetor; ensure the fuel is clean and fill with sufficient fuel.

2. Chain/Transmission and Shifting Issues

If there is rough shifting, difficulty engaging gears, or a feeling of poor power delivery: Check and adjust or replace the chain and sprockets; inspect the clutch cable and adjust clutch clearance if necessary; confirm the transmission oil level is normal.

3. Electrical or Ignition System Failures

In case of no response when trying to start or intermittent misfiring: Check the ignition coil/battery connections and secure them; replace damaged ignition components; inspect the main plugs and fuses to ensure they are tight.

Initial Startup Process

1. Engine Oil Maintenance

Engine oil plays a crucial role in lubrication and heat dissipation. It is recommended to perform the first oil change after the break-in period, and subsequently every 20–30 hours or at the end of each riding season (whichever comes first). If frequently riding in high-temperature, muddy, or high-load conditions, shorten the oil change intervals accordingly. Typically, 10W40 synthetic oil is recommended. For summer use, 15W40 may be suitable, while 10W30 is preferable for winter. When changing the oil, use the dipstick to check the oil level, ensuring it is within the specified range. Add oil according to the recommended quantity to the designated level, avoiding overfilling or underfilling.

2. Maintain the Fuel System

Regularly replace the fuel and clean the carburetor to prevent blockages in the fuel system. Ensure the fuel filter is unobstructed to avoid dirt entering the engine and affecting performance. Also, inspect the fuel tank for any leaks or damage.

Recommendations	Not Recommended
Regularly inspect the electrical system to ensure all wiring connections are secure, avoiding short circuits or electrical failures.	Neglecting electrical system inspections and delaying repairs or replacement of damaged components.
Regularly replace the fuel and clean the carburetor to ensure the fuel system remains unobstructed.	Using expired or contaminated oil, which can cause engine blockages or difficulty starting.
Check and adjust the chain tension, and inspect the clutch and gears for wear every 2,000 kilometers.	Neglecting the maintenance of the transmission system, leading to chain looseness and severe clutch wear.

Note: For more detailed maintenance instructions, please refer to the user manual.

Product Registration and Usage Feedback

Register Your X-PRO Vehicle

Please register your X-PRO vehicle to enable us to provide faster and more accurate service support. Registration allows us to:

- More precisely identify your vehicle and component compatibility
- Offer more efficient assistance when needed
- Archive your ownership information
