Initial Startup Process

1. Check the Fuel Tank and Fuel Valve

Ensure there is sufficient fuel in the tank and that the fuel valve is in the open position.

2. Turn On the Ignition, Shift to Neutral, and Prepare

- Insert the key and turn it to "ON".
- Shift the transmission into neutral (N) and place both feet firmly on the ground, ready to start.

3. Start the Engine

For a cold start, it is recommended to open the choke first. Push the kick starter down with full force until the engine ignites, starts, and runs. Let the engine warm up for about 30–60 seconds, then close the choke.

4. Start Driving

For automatic clutch engines: Shift into first gear and slowly apply the throttle to start moving.

Frequently Asked Questions

1. Difficulty Starting or Unable to Start

Ensure the fuel valve is open, the ignition switch is ON, and the vehicle is in neutral. For cold starts, the choke must be opened. Check that the spark plug is clean and securely connected. If repeated starting attempts fail, close the choke, fully open the throttle, kick the starter several times, then try again.

2. Engine Stalls Easily or Idles Unevenly

After starting, let the engine idle and warm up for 1–3 minutes. Use the choke appropriately for cold starts. Adjust the idle speed slightly higher using the carburetor idle screw. Avoid riding immediately without warming up the engine.

3. Lack of Power or Poor Acceleration

Check the air filter for blockage and clean or replace it as needed. Use fresh gasoline. Ensure the throttle cable moves smoothly without sticking. Check that the chain tension is normal (approximately 20–30 mm of slack).

Initial Startup Process

1. Engine Oil Maintenance

Engine oil plays a critical role in lubrication and heat dissipation. It is recommended to change the oil for the first time after the break-in period, and subsequently every 20–30 hours or each riding season (whichever comes first). If the vehicle is frequently used in high-temperature, muddy, or high-load environments, shorten the oil change interval accordingly. Generally, 10W40 synthetic oil is recommended. For summer, 15W40 may be used, while 10W30 is more suitable for winter. When changing the oil, check the oil level with the dipstick to ensure it is within the specified range, and add oil to the recommended level as instructed—avoid overfilling or underfilling.

2. Cleaning and Inspecting the Air Filter

Check the air filter every 200 to 300 kilometers, paying special attention to cleaning in particularly dusty environments. Keep the filter clean and replace it when necessary. A clean air filter ensures that the engine draws in clean air, improving engine performance and fuel efficiency.

Recommendations	Not Recommended
Regularly change the engine oil (first change after 1–2 hours, then every 10–20 hours thereafter).	Neglecting to inspect the battery and electrical system, especially in cold weather.
For cold starts, use the choke and allow the engine to warm up for 1–3 minutes.	Failing to check or ignoring tire wear and air pressure can lead to potential safety hazards.
Periodically inspect the chain, air filter, and critical fasteners.	Using a dirty or damaged air filter can impair engine performance.

Note: For more detailed maintenance instructions, please refer to the user manual.

Product Registration and Usage Feedback

Register Your X-PRO Vehicle

Please register your X-PRO vehicle to enable us to provide faster and more accurate service support. Registration allows us to:

- More precisely identify your vehicle and component compatibility
- Offer more efficient assistance when needed
- Archive your ownership information

Please scan the QR code below to register your product.

Share Your Story

You're also welcome to follow us on Instagram, TikTok, YouTube, and Facebook to explore authentic stories and moments from the X-PRO community. We look forward to seeing you share a photo or short video capturing joyful times with your family and your X-PRO. Every genuine moment tells a true X-PRO story.
