Initial Startup Process

1. Pre-start Check

Ensure sufficient fuel and that the transmission is in neutral. Check that the battery is securely connected with no obvious corrosion.

2. Turn on the Ignition

- Insert the key and turn it to the ON position.
- Make sure the engine kill switch on the handlebar is set to the RUN position, as switching it to "OFF" will cut the ignition.

3. Start the Engine

Squeeze the front brake and press the electric start button until the engine fires up.

4. Warm Up and Prepare to Ride

- After the engine starts, let it idle for a few minutes to warm up.
- For manual clutch engines: Squeeze the clutch lever, shift into first gear, gradually release the clutch lever while gently applying throttle to start moving.

Frequently Asked Questions

1. Unable to Start or Starting Failure

Confirm the ignition switch is ON and the kill switch is in the RUN position; shift the vehicle into neutral and pull the clutch tightly; check the battery charge; if voltage is low, recharge it promptly; each starting attempt should last 1–3 seconds, with a few seconds between attempts.

2. No Response or Weak Electric Start

Check that the battery connections are secure; if the battery is low, charge it with a charger or replace the battery; inspect the starter relay and related wiring connections.

3. Spark Plug Inspection

Check the condition of the spark plug every 15–20 hours, keeping it clean and securely connected; when starting abnormalities occur, inspect it first and replace if necessary.

Initial Startup Process

1. Battery Maintenance

Regularly check the battery charge level and connection status. When the vehicle is not in use for extended periods, recharge the battery periodically. If the voltage is low or performance declines, replace the battery promptly.

2. Engine Oil Maintenance

Engine oil plays a critical role in lubrication and heat dissipation. It is recommended to change the oil for the first time after the break-in period, and subsequently every 20–30 hours or each riding season (whichever comes first). If frequently used in high-temperature, muddy, or high-load environments, shorten the oil change interval accordingly. Generally, 10W40 synthetic oil is recommended. For summer, 15W40 may be used, while 10W30 is more suitable for winter. When changing the oil, check the oil level with the dipstick to ensure it is within the specified range, and add oil to the recommended level as instructed—avoid overfilling or underfilling.

Recommendations	Not Recommended
Change the engine oil at regular intervals (first change after 1–2 hours, then every 15–20 hours or once a month).	Riding under high load or at high RPM while the engine is still cold.
After starting, let the engine idle and warm up for 1–3 minutes before riding.	Leaving the battery unmaintained during long-term storage or using old fuel.
Regularly inspect the chain, air filter, and battery condition.	Neglecting chain lubrication or tension adjustment.

Note: For more detailed maintenance instructions, please refer to the user manual.

Product Registration and Usage Feedback

Register Your X-PRO Vehicle

Please register your X-PRO vehicle to enable us to provide faster and more accurate service support. Registration allows us to:

- More precisely identify your vehicle and component compatibility
- Offer more efficient assistance when needed
- Archive your ownership information

Please scan the QR code below to register your product.

Share Your Story

You're also welcome to follow us on Instagram, TikTok, YouTube, and Facebook to explore authentic stories and moments from the X-PRO community. We look forward to seeing you share a photo or short video capturing joyful times with your family and your X-PRO. Every genuine moment tells a true X-PRO story.
