Initial Startup Process

1. Pre-start Check

- Ensure there is sufficient fuel in the tank.
- Make sure the kill switch is set to the ON position.

2. Power On

Insert the key and turn it to the "ON" position to confirm the electrical system is functioning normally.

3. Start the Engine

After confirming the brake is engaged, press the electric start button to start the engine.

4. Begin Riding

Allow the engine to idle and warm up for a few minutes after starting, then gradually begin riding.

Frequently Asked Questions

1. Difficulty Starting the Engine

If the engine fails to start, check if there is sufficient fuel in the tank and ensure the fuel valve is open. Confirm that the ignition switch is in the "ON" position and the battery has adequate charge. Press the electric start button. If the engine still fails to start, check if the spark plug is clean and replace or clean it as necessary.

2. Engine Stalling

If the engine stalls, check the fuel system to ensure it is functioning properly and that the fuel lines are not clogged. Inspect the air filter for dirt or blockage and clean or replace it if needed. Ensure the spark plug is clean and maintains good contact.

3. Poor Braking Performance

If the brakes are ineffective, check whether the brake fluid is sufficient and inspect the brake pads for wear. If the brake pads are severely worn, replace them promptly. Check the brake system for any leaks and ensure the brake cables are not loose, adjusting them if necessary.

Initial Startup Process

1. Regularly Inspect the Battery and Electrical System

Check the battery charge monthly to ensure the connections are secure. If the battery is low, recharge or replace it promptly. Inspect the fuses in the electrical system to ensure wiring connections are intact, preventing electrical failures that could affect riding safety.

2. Engine Oil Maintenance

Engine oil plays a critical role in lubrication and heat dissipation. For a new vehicle, it is recommended to change the oil after the first 311 miles, then again after 932–1,243 miles. After this, oil changes can be performed approximately every 1,243–1,864 miles. If frequently riding in high-temperature, muddy, or high-load conditions, shorten the oil change intervals accordingly. Typically, 10W40 oil is recommended. When changing the oil, use the dipstick to check the oil level, ensuring it falls within the specified range. Add oil according to the recommended quantity to reach the designated level, avoiding overfilling or underfilling.

Recommendations	Not Recommended
Regularly inspect the electrical system to ensure all wiring connections are secure, avoiding short circuits or electrical failures.	Neglecting electrical system inspections and delaying repairs or replacement of damaged components.
Regularly replace the fuel and clean the carburetor to ensure the fuel system remains unobstructed.	Using expired or contaminated oil, which can cause engine blockages or difficulty starting.
Check and adjust the chain tension, and inspect the clutch and gears for wear every 1,243 miles.	Neglecting the maintenance of the transmission system, leading to chain looseness and severe clutch wear.

Note: For more detailed maintenance instructions, please refer to the user manual.

Product Registration and Usage Feedback

Register Your X-PRO Vehicle

Please register your X-PRO vehicle to enable us to provide faster and more accurate service support. Registration allows us to:

- More precisely identify your vehicle and component compatibility
- Offer more efficient assistance when needed
- Archive your ownership information

Please scan the QR code below to register your product.

Share Your Story

You're also welcome to follow us on Instagram, TikTok, YouTube, and Facebook to explore authentic stories and moments from the X-PRO community. We look forward to seeing you share a photo or short video capturing joyful times with your family and your X-PRO. Every genuine moment tells a true X-PRO story.
